1. Economic developments and central bank policy - a summary

1.1 International economic and monetary developments

In 1986 the development of the world economy was characterised by declining raw materials prices – notably oil prices – and the falling dollar rate. While the economies of the developing countries that depend largely on oil exports deteriorated and the international debt problem again moved to the fore, the upswing in the OECD countries continued.

Continuing upswing in the world economy

Domestic demand remained the chief pillar of the economy in the industrialised countries. In the United States growth stimuli derived mainly from consumption. In the European countries private consumption also picked up markedly and investment activity continued at a brisk pace. On the other hand, Europe suffered a slowdown in the growth of its exports due mainly to the marked slide of the dollar and diminishing sales in developing and newly industrialised countries. Whereas in the European countries the decline in the growth of exports was largely offset by the vigorous performance of the domestic economies, in Japan the adverse effects on business activity emanating from foreign trade led to a significant weakening of real economic growth.

Domestic demand is chief pillar of the economy

According to GATT estimates international trade expanded by about 4% in real terms, i.e. at roughly the same rate as in the previous year. Owing to lower import prices and lively domestic demand the imports of OECD countries exhibited a stronger rise; the oil-exporting developing countries, on the other hand, drastically reduced the volume of their imports.

Uninterrupted expansion of world trade

Despite the massive depreciation of the dollar the US current account deficit again rose to a record level in 1986 while the surpluses recorded by the European countries and Japan continued to expand. The oil-exporting developing and newly industrialising countries' overall deficit widened by \$40 billion.

Varying current account figures

Sustained economic growth in the OECD countries was accompanied by a further slight improvement in the employment situation. With the working population increasing at approximately the same rate, jobless figures remained unchanged from the previous year.

Slight improvement in employment levels in the OECD countries

In the wake of crumbling oil prices and exchange-rate-induced falls in import prices – notably for raw materials traded in dollars – the upward trend of consumer prices in the OECD countries continued to weaken. At 2.8% the rise corresponds to the average rate of increase in the sixties. After that, a higher annual inflation rate had been recorded for more than two decades.

Marked fall-off in inflation

Easing of monetary policies – unchanged fiscal policies

In the major industrialised countries the money supply aggregates expanded at an increasing pace and in some cases the targets fixed at the beginning of the year were considerably exceeded. It is difficult to assess to what degree monetary policy has actually been relaxed in view of the fact that in a number of countries innovations in the financial markets have distorted the reliability of money supply measures. As a result of the more rapid expansion of money supply and declining inflationary expectations interest rates eased notably in the first half of the year. This development has been given added impetus in most countries by a gradual lowering of discount rates. The fiscal policies of European countries have remained oriented to a further reduction in the growth of government expenditure. These outlays have again risen more steeply in the United States than in most European industrialised countries, with the budget deficit continuing to widen. Japan has pursued a somewhat more expansionary fiscal policy in the wake of slackening economic activity.

1.2 Economic developments in Switzerland

Continued economic growth in Switzerland

In 1986 Switzerland again benefited from a favourable economic climate. The growth rate of real GDP corresponded approximately to the average of the OECD countries. However, compared with the previous year, the economic upswing lost much of its momentum due to a decline in the expansion of Swiss exports as a result of the lower value of the dollar and a deteriorating economic situation in many developing countries. Domestic demand, in particular private consumption and capital expenditure, again rose vigorously in real terms. In the course of sustained economic growth the employment situation improved, with jobless figures continuing to fall.

Higher current account surplus

Lower prices for imported goods – notably for energy sources – led to a fall in nominal imports and a contraction of the trade balance deficit. The current account surplus, however, did not increase at the same pace since the surplus deriving from capital income and earnings from employment declined. According to a preliminary estimate the current account surplus amounted to Sfr 13.6 billion.

Temporary rise in interest rates

After having temporarily risen between March and June short-term Eurofranc rates eased in the second half of the year. Capital market rates moved in line with money market rates; at the end of the year they were a good quarter percentage point below the level prevailing a year earlier. The slide in the dollar rate, which had come underway in spring 1985, came to a standstill in summer 1986. After that the Swiss franc rate of the dollar underwent only slight changes during the rest of the year. Vis-à-vis the other major currencies – notably the D-mark and the yen – the exchange rate of the Swiss franc remained comparatively stable. An exception was sterling, which lost constantly in value until the end of the year.

Falling dollar rate

1.3 Some features of National Bank policy

At the end of 1985 the National Bank, in agreement with the Federal Government, decided to lower the growth target for the adjusted monetary base from 3% to 2%. Thus the expansion in the money supply envisaged for 1986 was fixed at a level which the National Bank expected to guarantee inflation-free growth of the Swiss economy in the long term.

Lower money supply target for 1986

Despite lowering the money supply target to 2% the National Bank did not significantly alter its policy since, at 2.2%, money supply growth in 1985 had already come close to the new target rate of growth. In 1986 the adjusted monetary base expanded by 2% – in conformity with the National Bank's objectives. Note circulation exceeded the previous year's level by an average of 1.4%, fluctuating more or less in the middle of the forecast range of 1% – 2%, while sight deposits at the National Bank increased by 2.6%.

On-target expansion of the adjusted monetary base

At the end of 1985 the labour market began to show distinct signs of overheating. The inflationary threat was not yet banished. In lowering the monetary target the National Bank underlined its intention of further reducing inflation in Switzerland. At the same time it was well aware that the scope for its monetary policy was liable to be narrowed by adverse developments on the foreign exchange market.

Anti-inflationary monetary policy

The experience gained since the changeover to flexible exchange rates in 1973 shows that monetary policy has an effect mainly on long-term price developments. However, the possibilities of the National Bank for exerting an influence on the short-term fluctuations of the inflation rate are limited. Such fluctuations, which are brought about by exchange rate movements and changes in raw materials prices as well as by economic developments and other factors, must continue to be reckoned with in future.

Effects of monetary policy

The annual growth potential of Switzerland's real GDP is estimated to be about 2% under present conditions. As price stability is considered to have been achieved when the annual change of the price index lies between zero

Demand for central bank money

and one percent, nominal GDP is expected to grow by somewhat more than 2%. In the longer term, demand for central bank money rises less markedly than nominal GDP; this implies that the velocity of the central bank money stock tends to increase slightly. An expansion of the adjusted monetary base of no more than 2% should thus bring about price stability.

Constant reappraisal of background conditions

Due to the tentative nature of the above considerations, the background conditions are subject to constant reappraisal. Uncertainties exist particularly with regard to the growth potential of the Swiss economy and the future development of monetary velocity.

The significance of the end-of-month settlements

The National Bank determines the course of its monetary policy primarily by setting an annual target for the adjusted monetary base. The latter is not subject to the influences of the end-of-month settlements and reflects the long-term trend in the development of the money stock. The annual target thus defines the fundamental direction of monetary policy. The results achieved by implementing monetary policy, however, do not depend solely on the development of the adjusted monetary base, but also on the money supply at the end of the month. Accordingly, the National Bank seeks to regulate the banking system's end-of-month sight deposits at the central bank in conformity with the annual target. While the National Bank saw no reason to deviate from the target for the adjusted monetary base in 1986, unforeseen difficulties arose in connection with the end-of-month settlements.

Relaxation of end-of-month settlement policy In spring 1986 demand for end-of-month liquidity rose to an unexpected extent. These liquidity problems were reflected by the comparatively high rates charged for last-day money. At the end of June the rate for overnight funds topped 100%, and the rate for three-month deposits on the Eurofranc market soared to a record level of 5.5% as a result of the tight conditions prevailing at the end of the month. In order to keep the effects of the end-of-month settlement policy consistent with the annual target of 2% the National Bank supplied the banks with additional liquidity at the end of July and also at the end of the ensuing months. While the banks' end-of-month sight deposits at the National Bank between January and June 1986 exceeded the previous year's level by an average of 2.9%, the corresponding increase in the second half of the year amounted to 6.1%. Subsequently short-term interest rates receded again.

Participation in international monetary measures In October the National Bank participated in the joint interventions of various European central banks in the foreign exchange markets for the purpose of securing orderly market conditions. Moreover, it cooperated with the monetary authorities of the United States, the other countries of the

Group of Ten, Spain and a number of Central American countries in financing a bridging loan in favour of Mexico.

The Governing Board of the Swiss National Bank, in agreement with the Federal Government, again set the money supply target at 2% for 1987. It is thus adhering to the monetary course followed in 1985 and 1986 with the aim of continuing to create the necessary background conditions for inflation-free economic growth. As usual, the money supply target is meant as a guideline. The National Bank reserves the right to deviate from this target in the case of unforeseen developments.

Unchanged money supply target for 1987

2. Monetary policy and financial markets

2.1 Development of the monetary aggregates

On-target expansion of the adjusted monetary base

In 1986 the adjusted monetary base expanded on average by 2%. The growth target of 2% set at the end of 1985 was thus reached. Note circulation and the banking system's sight deposits at the National Bank - the two components of the monetary base – rose by an annual average of 1.4% and 2.6% respectively. The comparatively modest expansion of note circulation is probably due mainly to the low inflation rate.

Accelerated growth of money stock M₁

The monetary aggregates in the broader sense showed irregular development. The money stock M₁, which in the longer term develops more or less in line with the monetary base, expanded by 4.5% in 1986 after having stagnated in 1985. While note circulation, which accounts for approximately one-third of the money stock M₁, increased at the same pace as in the previous year, sight deposits at the National Bank grew - following a slight decrease in the previous year - by 6.4%; this growth is attributable chiefly to money market rates which, having declined from their 1985 level, led to higher demand for liquid funds. By contrast, in the wake of falling interest rates the expansion of the money stock M₂ weakened slightly to 6.1%, since maturing time deposits were partly converted into investments carrying higher rates of return. The money stock M₃, which by and large follows the development of nominal GDP, increased by 6.8%.

Adjusted monetary base = Note circulation plus banking system's deposits with the SNB less end-of-month refinancing credits.

Money stock $M_1 = Currency$ in circulation plus sight deposits in Swiss francs (without precious metals). Money stock $M_2 = M_1$ plus time deposits in Swiss francs plus sight and time deposits in foreign currencies held by private residents with

Money stock M₃ = M₂ plus savings deposits held by private residents with banks.

Averages based on monthly figures. Change from previous year's level. Revised figures.

2.2 The financial markets

Money market

The decline in interest rates on the Eurofranc market which had started in spring 1985 continued during the first few months of 1986. In April and May money market rates moved up once more, only to fall again in summer and autumn 1986. At the end of the year they stood at approximately the previous year's level. The temporary rise in interest rates is attributable mainly to surging demand for liquidity on the part of the banks at the end-of-month settlement periods which caused the rate for day-to-day money to soar to over 100% at the end of June. The situation on the money market eased again when the National Bank supplied the banks with additional liquidity at the end of July and also adhered to this policy at the end of the ensuing months.

Temporary increase in money market rates

The maturity structure of interest rates remained largely flat during 1986. Only at mid-year did short-term interest rates temporarily exceed long-term ones as a result of the tight conditions prevailing on the money market. The interest differential vis-à-vis foreign countries, notably the United States, narrowed in 1986.

Flat interest rate structure

The time deposit rates of the big banks and the yields on money market debt register claims against the Federal Government remained on average $\frac{1}{2}$ percentage points below the interest rates on comparable Eurofranc in-

vestments. On 23 January 1987 the National Bank lowered the discount and lombard rates by half a percentage point to 3.5% and 5% respectively. This was the first time since March 1983 that official interest rates had been adjusted.

Increase in sight

As measured by the banks' giro accounts at the National Bank, annual average liquidity on the money market amounted to Sfr 8.3 billion. The additional sight deposits at the end of the month were made available mainly in the form of the traditional central bank credits while daily liquidity was regulated as usual with the aid of currency swaps.

Foreign exchange market and exchange rates

Receding dollar and sterling rates – stable D-mark In 1986 the Swiss franc rate showed divergent movements vis-à-vis those currencies that are of major significance for the Swiss economy. The exchange rate of the US dollar slipped from over Sfr 2.— at the start of 1986 down to Sfr 1.65 at mid-year, stabilising in the second half of 1986. Sterling, too, was subject to marked downward pressure. The D-mark/Swiss franc exchange rate, on the other hand, remained comparatively stable as in the previous year, fluctuating within a band of approximately five centimes. On an annual average, the Swiss franc rate of the D-mark remained virtually unchanged from the previous year in 1986. While the Swiss franc also maintained the previous year's level vis-à-vis the Italian lira it appreciated slightly against the French franc, though losing some ground against the yen.

Higher export-weighted exchange rate

The exchange value of the Swiss franc weighted according to the exports to Switzerland's fifteen major trading partners rose steadily in the course of 1986. On average, it exceeded the previous year's level by 9.4%. As the inflation rate in Switzerland was generally lower than in other countries, the Swiss franc underwent a less marked appreciation in real terms, at 6.8%, than in nominal terms.

Capital market

Decline in long-term interest rates Interest rates on the capital market developed more or less in line with the money market. After a brief period of strain around mid-year long-term interest rates eased again. Effective as from January 1987, most banks lowered their interest rates on mortgages and savings deposits – by a quarter percentage point – for the first time since 1983. Various insurance companies and a number of banks had already cut the interest rate for new mortgages a few months earlier.

Gross borrowing on the Swiss capital market in the form of public bond and share issues amounted to Sfr 61.5 billion in 1986, a year-on-year increase of some 23%. 18% of total gross borrowings was accounted for by domestic bond issues and 72% by foreign bond issues. The remainder of 10% was made up of share issues totalling three times the previous year's volume.

Increased gross borrowing on the Swiss capital market

The volume of net borrowing on the Swiss capital market (i.e. gross borrowing less conversions and repayments) also expanded in 1986. Domestic borrowers accounted for Sfr 10.9 billion, an increase of 30% over the previous year's figure. No reliable statistics on net borrowings in the form of foreign issues have been compiled though the available data likewise points to a vigorous increase.

Higher level of net borrowing

The volume of net borrowing in the form of domestic share issues expanded sharply. Particularly noteworthy was the net increase in share flotations of Swiss industry, which rose from practically zero in 1985 to Sfr 1.7 billion. By contrast, domestic bond issues exhibited a slight downward trend. This decline reflects in some measure the Confederation's favourable financial results in 1986 and the consequent repayment of debts. Compared with 1985, the Confederation reduced its debt burden on the capital market by some Sfr 600 million. Communal authorities and electric power companies, too, recorded a surplus of redemptions on the capital market over new issues.

Vigorous expansion in the volume of share issues

In 1986 the National Bank bought Swiss bonds with a nominal value of Sfr 484 million. After taking into account repayments to the tune of Sfr 281 million the net increase amounted to Sfr 203 million. The National Bank thus continued the diversification of its assets begun in 1982.

Purchases on the bond market

Capital exports authorised by the National Bank in 1986 totalled Sfr 52.5 billion, exceeding the previous year's level by 14%. This marked increase once again underlines the significance of the Swiss financial centre as a pivot of international capital flows. As in previous years, capital exports in the form of securities issues gained even further in importance, to the detriment of lending business.

Strong growth in capital exports subject to authorisation

The breakdown of capital exports subject to authorisation according to groups of countries and of borrowers respectively once again shows that the emphasis has shifted to industrialised countries, which in 1986 absorbed 85.7% of the total (1985: 79.2%). Fundraising by Japanese borrowers continues to be a very considerable factor: in 1986 these accounted for 28% of capital exports subject to authorisation (53% in the form of convertible or

Modest share of developing countries

Nominal and real exchange rates of the Swiss franc

Nominal Swiss franc rate in terms of foreign currencies (export-weighted index: November 1977 = 100).

warrant bonds). In 1986 the developing countries' share fell below the previous year's already extremely low level. The share attributable to the international development organisations also diminished. Since, however, in order to avoid oversaturating the market, these institutions – notably the World Bank – procured additional Swiss franc funds indirectly by means of currency swaps, the true significance of the Swiss capital market for the borrowing activities of international organisations is underestimated.

Innovations continued to be introduced in the Swiss capital market. In 1986

foreign borrowers launched new types of bonds whose repayment sums are linked to a share index or which are equipped with a gold warrant.

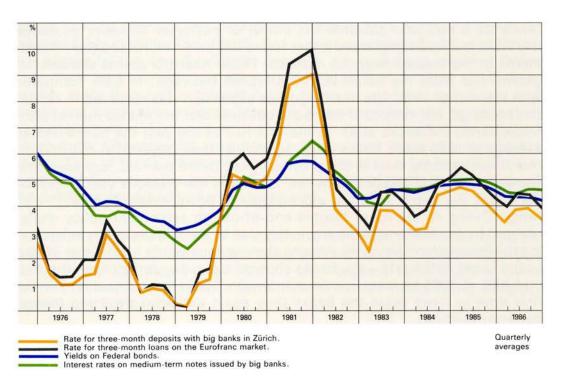

Other novelties included bonds redeemable in Canadian dollars and Swiss franc bonds on which interest is payable in foreign currencies (Foreign In

subscription of industrial shares.

Other novelties included bonds redeemable in Canadian dollars and Swiss franc bonds on which interest is payable in foreign currencies (Foreign Interest Payment Securities, FIPS). Domestic borrowers also resorted to new types of financing instruments. At the centre of attention were the subscription warrants on registered shares issued by the banks. A further novelty was the warrant bond floated by the city of Zurich, providing for the

New financial instruments

Money and capital market rates

2.3 Bank balance sheets

The favourable economic situation and the downtrend of interest rates characterised the development of the banks' balance sheets in 1986. When interpreting the figures the fact must be taken into account that the conversion rate applying to the dollar positions is lower than in the previous year. Thus the full dynamism of the banking industry's performance is not revealed by the 10.3% growth shown by the combined balance sheet total (71 banks) at the end of 1986. Calculated at unchanged exchange rates the balance sheet total would have increased by some 14%, compared with approximately 13% in 1985.

Lending business grew at a slightly slower pace than in the previous year. After reaching a peak in the first half of 1985, the outflow of funds began to exhibit a downward trend. The annual growth rate of domestic credits,

Balance sheet growth

Slightly weaker growth of lending business

which are almost exclusively denominated in Swiss francs, amounted to 9.0% at the end of 1986, compared with 9.9% a year earlier.

Higher level of investments

Since from mid-year onwards the inflow of customer deposits exceeded the volume of credits granted in net terms the banks increased their investments in the various financial markets. These financial assets showed net growth (i.e. after the balancing of interbank business) of 5.9% compared with the end of 1985. The most vigorous expansion was recorded in securities holdings; net income in interbank business and the money market portfolios hardly increased at all. In the first half of the year the banks had an average of 3.3% more Swiss franc liquidity at their disposal at the end-ofmonth settlements than in the previous year. Given the fact, however, that the cash holdings prescribed by law exceeded the previous year's level by 5% - 10% the banks resorted increasingly to liquid assets in foreign currency. Owing to the more flexible end-of-month settlement policy implemented by the National Bank since July and to the decline in the volume of legally required minimum liquidity to the previous year's level - due in part to the lower dollar rate - the banks showed a growing tendency in the second half of 1986 to meet requirements with Swiss franc liquidity. For the first time in three years the banks thus again exhibited declining foreign currency holdings.

Abolition of technical distinctions between public bonds and medium-term Swiss franc notes with effect from 29 May 1986 (cf. section 2.4 on capital exports subject to authorisation).

The growth of customer deposits, i.e. of the funds put at the banks' disposal by the non-bank sector, accelerated somewhat compared to 1985. In the Swiss franc sector the annual growth rate amounted to 9.6%. Sight deposits, savings deposits and in particular medium-term notes and bonds increased fairly steadily. The sole decline – over an extended period of time – was shown by the item fixed-term deposits. For one thing, expiring Swiss franc time deposits were not always renewed as their interest yields were usually more than half a percent below those on medium-term notes and bonds and hardly ever exceeded the rate on savings deposits by more than a quarter percent. For another, the exchange rate-induced lower value at which dollar time deposits are entered in the balance sheet also constitutes an "outflow of funds". Since all types of investments at banks with the exception of time deposits benefited from an inflow of funds the structure of the liabilities remained virtually unchanged.

Stronger growth of customer deposits

The volume of trustee funds of all the banks combined diminished by 12.6% in 1986 following a contraction by 6.6% a year earlier. The decline is due primarily to the depressed level of short-term interest rates and the lower conversion rate of the dollar – some 60% of trustee funds being denominated in the US currency.

Decline in fiduciary business

2.4 Other measures of central bank policy

Capital export policy

By virtue of Article 8 of the Banking Law, the issuing of foreign bonds and the granting of credits to borrowers domiciled abroad by banks and investment companies in Switzerland and the Principality of Liechtenstein are subject to authorisation if these transactions amount to Sfr 10 million or more and are for a period of one year or more.

Legal basis: Article 8 of the Banking Law

With effect from 29 May 1986, the Governing Board has lifted the regulations on maturities and the early redemption of bond and note issues of foreign borrowers. Moreover, minimum denominations and deposit requirements for note issues have also been abolished, as has the obligation to report Swiss franc placements with foreign banks and monetary authorities. However, transactions requiring general authorisation, such as participation in foreign currency operations handled by foreign institutions, continue to be subject to notification.

Lifting of technical restrictions in the issuing sector

Legal framework of the Swiss financial centre

Changing financial markets

The vigorous expansion of the securities markets and the spread of new financial instruments make it necessary to constantly review the legal framework concerning the Swiss markets. In 1986 questions relating to investor protection and the continued and unimpeded functioning of the markets were at the centre of discussion.

Listing of foreign securities on the stock exchange

Based on the agreement concerning the listing of foreign securities on the Swiss securities markets ("Vereinbarung betreffend die Zulassung von ausländischen Wertpapieren zum offiziellen Handel an den schweizerischen Effektenbörsen") concluded in 1938, the National Bank has the right to file an objection to the listing of foreign securities the issuing of which it has not already authorised in accordance with Article 8 of the Banking Law. Barring any such objections, a special admission board on which the National Bank is not represented handles the application. Since capital exports have been liberalised to a considerable extent the National Bank's right to object has lost much of its meaning. Of late, moreover, the admission board has met with criticism concerning investor protection and the freedom of competition in the issue market. The National Bank regards an up-to-date legal framework as indispensable for the functioning of the Swiss securities markets, particularly also in view of the planned introduction of organised trading in options and financial futures. For this reason, it is participating in the revision of the 1938 agreement.

Investor protection in the notes sector

In the business year 1986 the Governing Board took cognisance of the final report drawn up by a study group consisting of representatives of the Federal Finance Administration, the Banking Commission and the National Bank, which had investigated the possibilities for improving the protection of investors in notes. The study group had established that today most notes are floated publicly, which involves, as a prerequisite in terms of Article 1156 of the Swiss Code of Obligations, the issuing of a prospectus. The draft of a convention circumscribing the banks' obligations in the investors' interest which was subsequently prepared did not, however, gain the approval of the principal banks concerned. The study group ended its activity after the Federal Banking Commission, in a circular letter, had announced its intention to define precisely the distinction between publicly issued notes and actual private placements should an agreement between the banks based on the rejected draft fail to be reached.

Expiry of the agreement on the observance of care by the banks

The Governing Board decided to terminate the agreement on the observance of care by the banks in accepting funds and on the practice of banking secrecy at the end of the current contractual period, i.e. as per 1 October 1987. The National Bank had consented in the special circumstances pre-

vailing in 1977 to become a party to this agreement. The fact that participation in the agreement was a borderline case in terms of the central bank's monetary policy mandate, as well as procedural and substantive weaknesses of the agreement itself, have induced the National Bank to free itself of the contractual obligations, which had never been considered more than a temporary solution.

Payments transactions

The planned new Swiss interbank payments system (SIC) is expected to come into operation in the course of 1987. The concept provides for a central computer system by means of which so-called SIC clearing accounts are administered. Every participant has a direct link to the system via his own computer. He can, among other things, dispose of the funds on his clearing account and retrieve the remaining balance at any time. Balances held on clearing accounts are sight liabilities of the National Bank and thus constitute central bank money. Telekurs AG has been commissioned by the National Bank to operate the system.

"Swiss Interbank Clearing"

In 1986 the legal and organisational basis for regulating cooperation between the banks, Telekurs AG and the National Bank within the framework of SIC was created. Moreover, the technical realisation neared completion and final operating tests were started.

Carrying out final operating tests

Cooperation of the National Bank in international monetary measures

In August 1986 the monetary authorities of the United States and of the other countries of the Group of Ten, Spain and a number of Latin American countries granted Mexico a bridging loan to the tune of \$ 1.1 billion to meet its immediate liquidity requirements. The Swiss National Bank entered into a substitution undertaking to the amount of \$ 30 million for that part of the bridging loan which was made available via the Bank for International Settlements (BIS). It is based on the decree of the Federal Parliament concerning Switzerland's cooperation in international monetary measures and is guaranteed by the Federal Government. The credit is due to be repaid in February 1987. At the end of the year the amount of the commitment still outstanding totalled \$ 10.9 million.

Switzerland participates in bridging loan for Mexico

In 1986 the IMF repaid the first tranche of a credit granted by the National Bank in April 1984. This loan to the amount of 180 million Special Drawing Rights (SDRs) represents the National Bank's contribution to a facility to-

Partial repayments of credits by the IMF and Turkey

talling 6 billion SDRs in favour of the IMF made available by the BIS and 19 industrialised countries and Saudi Arabia. Moreover, the IMF repaid a further tranche of the credit provided by the National Bank in 1979 under the "Witteveen" facility. In keeping with the terms of the agreement, a substantial amount of the credit of \$45.5 million granted by the National Bank to Turkey was repaid; this loan is equipped with a Federal guarantee.

Participation of the National Bank in stand-by arrangements at the end of 1986

		Original undertakings	Outstanding credits		Outstanding undertakings
_			End 1985	End 1986	End 1986
١.	Swap agreements				
	Federal Reserve Bank of NY	\$ 4 billion		0	\$ 4 billion
	Bank of Japan	Yen 200 billion		0	Yen 200 billion
	BIS	\$ 600 million		0	\$ 600 million
2.	Multilateral credits				
	General Arrangements to Borrow (GAB)	SDR 1020 million		0	SDR 1020 million 1
	IMF "Witteveen" facility	SDR 650 million	SDR 500.7 million	SDR 369.8 million	0
	Credit commitment to BIS in favour of IMF	SDR 180 million	SDR 180 million	SDR 176.4 million	0
3.	Bilateral credits				
	Turkey ²	\$ 45.5 million	\$ 45.5 million	\$ 15.5 million	0
	Yugoslavia ²	\$ 80 million	\$ 58 million	\$ 58 million	0
1 .	Substitution undertaking				
	Mexico ²	\$ 30 million	_	\$ 10.9 million	0

¹ It has been egreed that if the GAB ere utilised the credits granted within the context of the SDR 180 million credit commitment vis-à-vis the BIS in favour of the IMF will be deductible. Thus the actual open undertaking et the end of 1986 amounted to SDR 843.6 million.
2 With Federel Government guerantee.

Explanatory notes on the profit and loss account

The chief feature of the profit and loss account in 1986 was again the high level of write-offs – amounting to Sfr 3.7 billion (1985: Sfr 3.6 billion) – on foreign currency holdings. This book loss is due to the decline of the dollar rate from Sfr 2.103 at the end of 1985 to Sfr 1.666 at the end of 1986 (in each case December averages). Write-downs were covered by the liquidation of the balance sheet item "valuation adjustment to foreign exchange holdings" (Sfr 1.6 billion), by current income (Sfr 1.7 billion) and by drawing on the provisions for currency risks (Sfr 0.4 billion). Following an allocation of Sfr 3 million to the staff welfare facilities a net profit of Sfr 7.6 million remained.

Earnings in the foreign exchange sector tumbled from Sfr 2.7 billion in 1985 to Sfr 1.8 billion in 1986 in the wake of falling US interest rates and due to the conversion of foreign currency into Swiss francs. With rates unchanged at 4% and 5.5% respectively, income from discount and lombard business – totalling Sfr 49.3 million – was slightly down from the previous year's level. The decline is attributable to a fall-off in the utilisation of discount credits. Earnings from lombard business, on the other hand, continued to improve. Income from securities increased to Sfr 123.4 million – the result of a larger portfolio.

Total staff expenditure fell to Sfr 52 million concomitant with a small reduction in the number of employees. Expenditure on premises receded to Sfr 4.9 million; the outlays were for current expenses. The cost – totalling Sfr 26 million – of purchasing the share company Hotel Bellerive au Lac, Zurich, was written off via the profit and loss account. For the first time the item "other expenditure on materials" included an advance for running expenditure to the Gerzensee study centre foundation (Sfr 4.2 million).

Expenditure in connection with the issue and circulation of bank notes climbed to Sfr 18.7 million. The increase derives chiefly from the higher cost of paper, printing and insurance. Interest payments on the Federal Government's balances rose to a total of Sfr 58.5 million.

Book profits on repayments of securities previously written off (Sfr 60.6 million) were set off against the cost of depreciation of securities acquired in the year under review (Sfr 155.1 million). On balance, this resulted in a write-off totalling Sfr 94.5 million.

4.1 Supervisory authorities

Bank Council

40 members

President:

François Schaller

Vice-President:

Peter Gerber

Bank Committee

10 members of the Bank Council, including its president

and vice-president

Local committees

3 members each; at both head offices and the eight

branches

Auditing Committee

Chairman:

Gilbert Grenier
